WVU Public Interest Communication Research Laboratory (PIC Lab)

- Public interest communication (PIC) merges theory and practice by examining the development, implementation, and evaluation of science-based strategic communication efforts to achieve and sustain publics' attitudinal and/or behavioral changes regarding a public interest issue.
- The WVU PIC Research Lab unites social and behavioral scientists to research:

**Community Advocacy
and Engagement**

**Crisis and Risk
Communication**

Media Sociology

**Science
Communication**

WV Joint Interagency Task Force on COVID-19 (JIATF)

- Unified command system appointed by Governor Jim Justice
- In partnership with WV Department of Health & Human Resources and other state agencies and community organizations
- Within the JIATF is the Joint Information Center (JIC)
 - **Partnerships** for coordinated strategic communication
 - Evidence-based, data-driven communication tailored to West Virginians and targeted toward specific populations' wants and needs

Learning Objectives

- 1 Describe the attitudes, perceptions, and beliefs that influence vaccine confidence.
- 2 Apply social and behavioral science to effectively talk with patients and communities about immunization.

Pair & Share

Why do you think people choose to get vaccinated (or approve it for those they care for)?

Why do you think people choose not to get vaccinated (or do not approve it for those they care for)?

Vaccine Hesitancy & Confidence

Vaccine Hesitancy

The SAGE Working Group on Vaccine Hesitancy:

- Delay in acceptance or refusal of vaccination despite availability of vaccination services
- Vaccine hesitancy is complex and context specific
- Varies across time, place, and vaccines
- Influenced by factors such as complacency, convenience, and confidence

The Strategic Advisory Group of Experts on Immunization (SAGE) is charged with advising WHO on overall global policies and strategies, ranging from vaccines and technology, research and development, to delivery of immunization and its linkages with other health interventions.

Source: MacDonald NE; SAGE Working Group on Vaccine Hesitancy. Vaccine hesitancy: Definition, scope and determinants. Vaccine. 2015 Aug 14;33(34):4161-4. doi: 10.1016/j.vaccine.2015.04.036. Epub 2015 Apr 17. PMID: 25896383.

Vaccine ~~Hesitancy~~ Confidence

Vaccine confidence

- The extent to which individuals are motivated or willing to get vaccinated
- Vaccine **confidence** is complex and context specific
- Varies across time, place and vaccines
- Influenced by factors such as perceived risk, access, safety, effectiveness, opinions of important others

MacDonald NE; SAGE Working Group on Vaccine Hesitancy. Vaccine hesitancy: Definition, scope and determinants. *Vaccine*. 2015 Aug 14;33(34):4161-4. doi: 10.1016/j.vaccine.2015.04.036. Epub 2015 Apr 17. PMID: 25896383.

Vaccine Acceptance Continuum

Attitudes, Perceptions, & Beliefs that Influence Vaccine Confidence

Immunization intentions are shaped by...

Attitudes

- **affective attitudes** (positive or negative emotions), **instrumental attitudes** (perceived outcomes of vaccination)

Norms

- **subjective norm** (pressure from one's network), **descriptive norm** (belief one's network is choosing vaccination)

Perceived Control

- **perceived behavioral control** (belief in own control over behavior), **self-efficacy** (confidence they can do it)

Perceived Threat

- **perceived severity** (of the risk/disease), **perceived susceptibility** (of encountering the risk), **negative emotions**

Perceived Efficacy

- **self-efficacy**, **response efficacy** (confidence that the behavior, i.e. vaccination, will protect from the risk/disease)

Information Source & Channel

- **credibility, trust**

Data-driven Translational Science to Boost Vaccine Confidence

To understand risk/health beliefs, perceptions, attitudes, behaviors, we used mixed-methods social science:

- **Quantitative inquiry**
 - Statewide surveys, particular population surveys, message/appeal testing experiments
- **Qualitative inquiry**
 - Focus groups, in-depth interviews, intercept interviews, direct observation, social sentiment analysis
- Grounded in risk/crisis communication science & behavior change theory

A few examples...

The HPV Vaccine is Cancer Prevention

For more information about HPV vaccination, talk to a health care provider.

Get ready to go back-to-school.

Make sure your preteen or teen is up to date on his or her vaccinations for the upcoming school year.

Routine vaccinations can be given at the same time as COVID-19 vaccination.

Children who are eligible to receive the COVID-19 vaccine can get it at the same visit as other childhood and adolescent vaccines.

Plan ahead for multi-dose vaccinations.

Some vaccinations need more than one dose to be fully effective.

The cancer-preventing HPV vaccine, for example, is:

Two doses for 9-14 year olds **OR** Three doses for teens 15 or older

How to get preteen and teen vaccines.

Preteen and teen vaccines are low or no cost.

- ✓ Most health insurance plans cover preteen and teen vaccinations.
- ✓ Vaccines for Children (VFC) program provides vaccines for children 18 years and younger who are uninsured, underinsured, Medicaid-eligible, American Indian, or Alaska Native.

Adolescents can receive vaccines at their:

- ✓ Health care provider's offices;
- ✓ Community health centers;
- ✓ Local health departments;
- ✓ At most school-based clinics; and,
- ✓ Pharmacies (for some vaccines, a prescription may be needed).

For more information about HPV vaccination, talk to a health care provider.

HPV Vaccination: Protecting Preteens and Teens from Future Cancer

Human papillomavirus (HPV) can lead to certain types of cancers. Infections from HPV often do not have any immediate symptoms or warning signs. Here's why it's so important to get your preteen or teen vaccinated against HPV.

HPV vaccination is cancer prevention.

HPV can cause cancers of the penis, anus, cervix, vagina, vulva, and throat, including the tongue and tonsils.

The HPV vaccine is effective at preventing the types of HPV that can lead to cancer.

Infections with HPV types that cause most HPV cancers have dropped 86% among teen girls since the HPV vaccine became available.

Anyone can get cancer from HPV infection.

HPV causes almost all cervical cancers in women.

More than 4 out of every 10 cases of cancer caused by HPV occur among men.

Vaccinating preteens and teens against HPV now prevents cancer later.

HPV vaccination prevents new HPV infections but does not treat existing HPV infections.

HPV vaccination works best when given before exposure to the virus.

HPV vaccination is safe, effective, and provides lasting protection against HPV.

When to get protected:

The ideal age for HPV vaccination for boys and girls is 9-12 years or older.

Boys and girls who receive the HPV vaccine prior to age 15 only need two doses. If starting after age 15, the HPV vaccination is given in three doses.

For more information about HPV vaccination, talk to a health care provider.

COVID-19 Vaccination Due Date Calculator

Welcome to the COVID-19 Vaccination Due Date Calculator.

With the ever-changing nature of the virus that causes COVID-19, clear information about vaccination and how to stay protected is important. The purpose of this tool is to make it easier for you to stay up to date on your COVID-19 vaccination.

Responses entered into this tool are not visible to, and are not stored by, the West Virginia state entities managing this application. It is run on the user's web browser and is solely to provide information to the user and no other individual or entity.

In the upcoming pages, you will see:

- **Introductory information** (such as a reminder to get your COVID-19 Vaccination Card if you have one)
- **Disclaimer information** (such as what the tool is and isn't)
- **Questions** (only those required to calculate your COVID-19 vaccination due date)
- **When you may become due** for a COVID-19 vaccine shot (and for **what type**)
- A medical information **page for healthcare professionals** at the end

Next

Step 2: View Welcome/Disclaimer

COVID-19 Vaccination Due Date Calculator

This calculator is a tool that can be used to determine when you may be due for a COVID-19 vaccine. To do so, please fill in the following information for yourself (or, if you are the authorized guardian/caregiver using this tool for someone else, fill it in that person's information).

If you have had any previous COVID-19 shots, please have your COVID-19 Vaccination Card handy.

The tool's questions will ask about:

- birthdate,
- type and number of COVID-19 shots received (if any),
- whether you are considered moderately to severely immunocompromised, and
- the date of the most recent COVID-19 shot

This will let the tool calculate for you if/when you may be due for a COVID-19 vaccine. Please provide additional information about what type of vaccines are recommended based on various factors at the end of the tool.

This is meant as an individual education tool and not to replace licensed medical advice. **Change, so please check back periodically.**

More information about the purpose and limitations of this tool is next.

CVDD Calculator Disclaimer

This tool is a product of the WV Governor's Joint Interagency Task Force for COVID-19 and the WV Department of Health and Human Resources' Bureau for Public Health.

This tool is based on [U.S. COVID-19 vaccination guidelines](#) and was last updated Wed, May 11, 2022.

The information contained in this product is not intended to be, nor should it be used as, a substitute for the exercise of professional judgement by a licensed healthcare provider.

This tool does not account for all possible medical situations. The West Virginia state partners who manage this tool have strived to use best efforts to accurately convey immunization recommendations for COVID-19 vaccines, but cannot guarantee whether it is outdated, incomplete, or accurate in all cases.

This tool is to be used as a method **for individuals to simplify and customize complex medical information** in a general way to determine when the user may be due for another shot to stay up to date on COVID-19 vaccination, and it does not constitute, or substitute for, licensed medical practice.

FIRST COVID-19 Vaccine Type

Step 3: Make Selections

COVID-19 Vaccination Due Date Calculator

4. Are you considered moderately to severely immunocompromised (see definition below)?

Being immunocompromised in certain ways affects the number of shots a person may need to build adequate immune response for protection against COVID-19.

You may be considered as moderately or severely immunocompromised in the COVID-19 vaccination context if you have:

- Been receiving active cancer treatment for tumors or cancers of the blood
- Received an organ transplant and are taking medicine to suppress the immune system
- Received a stem cell transplant within the last 2 years or are taking medicine to suppress the immune system
- Moderate or severe primary immunodeficiency (such as DiGeorge syndrome, Wiskott-Aldrich syndrome)
- Advanced or untreated HIV infection
- Active treatment with [high-dose corticosteroids or other medications](#) that may suppress the immune response

✓ No

Best practices for vaccine communication

What to avoid...

- Do not repeat rumors or misinformation
- In responding, if the negative is false, the positive is true – frame positively
- Use “Yes, and...” (rather than “but”)
- No overt persuasion, or even the perception of it – just the fact
- No fear, guilt, shame appeals (not a hint of judgement)

Best practices for vaccine communication

What to focus on!

- Start from a place of empathy and understanding
 - Listen and respond to patient questions
- Enhance confidence in vaccine safety
- Know that it may take more than a single conversation
- Give your strong recommendation
 - Showcase motivating benefits
 - Remove barriers or perceived barriers
- Wrap-up conversation with openness and a call-to-action
 - Underscore hope, optimism, trust, and confidence
